# Reasons To Use VPN

Virtual Private Network (VPN) helps users in sharing data across public networks as if their devices are directly connected to a private network.

Following are some reasons to use VPN:

1 Using a VPN in conjunction with a browser offering high-privacy settings allows a user to be truly anonymous and protected while accessing his business applications from different locations.

2 A VPN helps in securing user's banking information & adds to the convenience of using online banking offered by the financial institutions from various locations.

3 While shopping online, VPN helps in adding a secure layer to protect user's banking details like card number, password, etc.

4 Using public hotspot in a coffee shop or airport makes user's information (password & personal data) vulnerable to cyber criminals. A secure VPN provides safety layer to protect you from identity-theft.

5 VPN helps in creating a secure tunnel by using end-to-end encryption to protect data being transferred between user's device and business server.
