

Protecting Your Home IoT Devices

Internet of Things has secured its place in smart homes. However, it is necessary to follow some precautions to protect your IoT devices at home from hackers.

- 1 There is a necessity to change default usernames and passwords. Use a mix of letters, numbers and symbols. Install a password manager to keep track of your passwords.
- 2 Regularly update the device firmware as it protects the system against viruses and malware. Connect device for automatic upgrade or schedule it.
- 3 Know the settings of your device to protect it from unwanted cyber intrusions. Devices may have additional security measures that need your permissions to work.
- 4 Create a separate network for your IoT devices. Separating it from office network will prevent unauthorized access to important files and documents in case IoT devices are compromised.
