

5G & Data Security

5G will facilitate massive expansion of IoT devices by providing faster speed & versatility. But, organizations need to employ some measures to secure their data and network before shifting to 5G.

1 Adopt virtualized and automated security controls to manage expanded networks and respond immediately to new attacks.

2 Implement Machine Learning to automate threat detection by sifting through the large amount of data that will be generated by 5G.

3 Consider a 'Zero-trust model' to continuously monitor, identify and authenticate users to avoid the introduction of a malware.

4 Switch to a shared security model to use network itself as a security tool while the organization secures the end-points.
